

**NEW SEQUEST**  
**TOILET BOWL & URINAL CLEANER WITH “CLING”**

**NEW SEQUEST** provides the very latest technology in a product specifically formulated to: **CLEAN, DISINFECT, DEODORISE** the complete toilet system in one operation.

**BACKGROUND**

This system harbours those harmful pathogenic (disease-causing) bacteria which are the normal resident of the human bowel, as well as transient bacteria from people suffering from some specific disease such as hepatitis, gastro-enteritis and others.

Medical Research studies have proved that the flushing of the toilet system promotes an infectious droplet aerosol effect in the toilet area, emanating not only from the human waste but also from the faecal debris which resides up under the rim of the toilet bowl.

**NEW SEQUEST** is provided with a unique dispensing head which allows the potent cleaner and bactericide to be directed up into this area to attack and remove this harmful resident soil. The effectiveness of the product is greatly enhanced by the concentration and thickness of the product which allows for an extended dwell time on the vertical surfaces.

**NEW SEQUEST** has been tested by an independent microbiological laboratory to pass the revised T.G.A test for hospital Grade Disinfectants (Dirty Conditions) against the following test organisms:

Pseudomonas aeruginosa	NCTC 6749
Escherichia coli	NCTC 8196
Staphylococcus aureus	NCTC 4163
Proteus vulgaris	NCTC 4635

### **ODOUR CONTROL**

Because many bacterial strains release obnoxious gases when multiplying in the toilet system, **NEW SEQUEST** has been designed to effectively remove the soil, kill the harmful bacteria and consequently provide a neutral air freshened effect in the toilet area.

### **URINAL CLEANER**

**NEW SEQUEST**, although acid in nature, does not contain the normal corrosive and indeed dangerous mineral acids so often used in toilet cleaners.

### **MATERIAL SAFETY**

Therefore, there is NO attack on stainless steel or chrome surfaces, and the product is safe to use on all surfaces associated with both the toilet bowl and urinal system.

In addition, the thickness of the product has been specifically formulated to provide not only concentration of product but also a non splash safeguard for the user, and a longer contact time for extra product performance.

### **DIRECTIONS**

**Toilet Bowl** - Flush the toilet then use the dispenser head to direct a stream of product under the toilet bowl rim and around the inside wall.

Because the product is thicker than normal types it will 'cling' to the vertical surfaces allowing greater contact time and therefore increased effectiveness.

Using a mop or brush (not wire type) swab the solution over the whole toilet system before agitating up under the rim.

Thoroughly agitate within the bowl and flush. Any foam residue will quickly dissipate.

**Urinal** - Flush the system and direct the product on to those areas which show evidence of uric encrustation or water stains.

Agitate with a mop or brush and flush to remove all loosened soil from the surfaces.

**Shower Recesses** - Very often a build up of soap scale, body fats and hard water scale occurs in tiled shower recesses.

This can be correctively cleaned by diluting **NEW SEQUEST** 1:10 with water, agitating and thoroughly rinsing. This area can then be maintained using **ELITE**.

### **CAUTION**

As the product is acid-based, care should be taken to keep away from eyes and sensitive skin. If splashed, wash affected area immediately with copious quantities of running water.
